Part A

Part A of the problem asks us to plot $y_n = e^{\frac{x^2}{2}} H_n(x)$ when $n = [0, 1, 2, 3]$, where $H_n(x)$ is the Hermite polynomial. The plot, Figure 2, was generated with the code displayed in Figure 1.

```
1 % declare symbol to be used in function
2 syms x;
3
4 % calculate hermite polynomials
5 h = hermiteH([0,1,2,3],x);
6
7 % calculate the functions to be plotted
8 y=exp((x^2)/2) * h;
9
10 % plot the functions
11 fplot(y)
```

Figure 1: The MATLAB code for generating the plots of $y_n = e^{\frac{x^2}{2}} H_n(x)$ for $n = [0, 1, 2, 3]$.

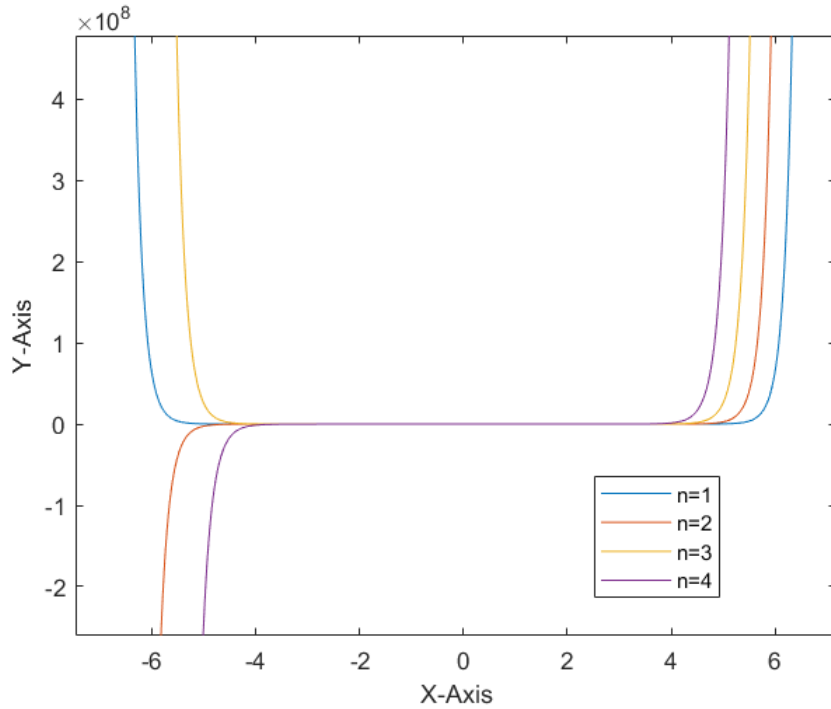

Figure 2: The plots of $y_n = e^{\frac{x^2}{2}} H_n(x)$ for $n = [0, 1, 2, 3]$.

Part B

Part B asks us to use the MATLAB function `bvp4c` to find the first four eigenfunctions of the boundary value problem

$$\begin{aligned} y'' + (\lambda - x^2)y &= 0 \quad -L \leq x \leq L \\ y(-L) &= y(L) = 0 \end{aligned}$$

Unfortunately, we had some trouble implementing `bvp4c` in code, Figure 3. We could not come up with a valid initial guess of the solution, the function on line 27. MATLAB complained that a singular Jacobian was encountered, which indicates that the solution diverges. We do not know how to guess a solution

that does not produce that error, i.e. one that does not diverge.

```

1  function mat4bvp
2
3  lambda = 0;
4  solinit = bvpinit(linspace(-100,100),@mat4init,lambda);
5  sol = bvp4c(@mat4ode,@mat4bc,solinit);
6
7  fprintf('The fourth eigenvalue is approximately %7.3f.\n',...
8          sol.parameters)
9
10 xint = linspace(-100,100);
11 Sxint = deval(sol,xint);
12 plot(xint,Sxint(1,:))
13 axis([-100 100 -100 100])
14 title('Eigenfunction of Hermite polynomial.')
15 xlabel('x')
16 ylabel('solution y')
17 % -----
18 function dydx = mat4ode(x,y,lambda)
19 dydx = [ y(2)
20          -(lambda - (x^2)) * y(1) ];
21 % -----
22 function res = mat4bc(ya,yb,lambda)
23 res = [ ya(1)
24         yb(1)
25         0 ];
26 % -----
27 function yinit = mat4init(x)
28 yinit = [ x
29           1 ];
30 % singular Jacobian error is because guess is divergent

```
